SkyTech Sharif Flight E-Library

The SkyTech Sharif Flight E-Library is an all-in-one software solution for the Electronic Flight Bag (EFB). It is designed to help airlines easily manage, access, and securely share all their important operational documents and information. The system provides one central, reliable, and up-to-date place for flight crews and other staff to find the manuals, forms, and technical data they need for their work.

This software was created because a move toward digital operations is being made across the aviation industry. Many international products are often found to be expensive, difficult to access, or inadequately flexible for the specific needs of every airline. Cross-platform capabilities are featured by the software, and daily operations are supported through smooth functionality on both Web Applications (PWA) and iOS devices. A detailed user permission system is also included in the platform. Through this feature, specific access levels for different roles, such as pilots, technical office staff, and flight control, are allowed to be set by administrators. As a result, the required information can be quickly obtained by all personnel while all data is kept entirely secure.

Through the use of the Flight E-Library, document management can be transformed from a scattered, paper-based system into a single, organized digital platform. Information is found faster, work-related delays are reduced, and teamwork between flight and technical departments is significantly improved by the software. Consequently, better discipline is achieved, document tracking is made easier, and enhanced control over workflows is provided. Ultimately, real value is added to operations, the airline is made more resilient, and the organization's move toward a fully digital future is supported by the system.

Login

The Login module is established as the secure entry point to the SkyTech Sharif Flight E-Library. Access to the platform is strictly role-based; upon the entry of credentials, the account is automatically authenticated, and access is granted to the specific features, documents, and administrative controls associated with the assigned role (e.g., Pilot, Admin, Technical Office).

To ensure the safety of operational data, the authentication process is designed in compliance with industry-standard login and security protocols.

In the event that credentials are forgotten, a Forgot Password feature is provided directly on the login screen. When this feature is utilized, a password reset is securely initiated, and the new password is sent to the email address registered in the profile, allowing access to be regained following standard verification steps.

Profile

Upon successful login, the Profile module is accessed as the initial section. Core personal and professional information, including the full name, system ID, and designated role (such as Captain or First Officer), is displayed in this area.

For users assigned the Pilot role, the Profile section is utilized as a dedicated hub for personal document management. Digital copies of essential operational documents, including Medical Certificates, Passports, and LPR, can be completely entered and uploaded.

To ensure continuous compliance with aviation regulations, document validity is tracked using the submitted data. Once documents are uploaded, their status is automatically monitored by the software, and timely notifications are generated so that licenses and certificates can be renewed before expiration. Specifically, when between 30 and 10 days remain until the expiration date, an orange warning is displayed. When 10 days or fewer remain, the warning is changed to red.

Documents

The Documents module is established as the central and most critical component of the Flight E-Library system. To ensure optimal organization and operational efficiency, the interface is structurally divided into the following two primary sections:

- All documents
- Clipboard

Within the “All Documents” tab, comprehensive access to the entire repository of digital manuals, operational files, and forms is provided. Navigation is facilitated through a hierarchical directory structure, which displays primary organizational categories such as fleet type, airline directives, training resources, safety issues, and operational forms. This categorization framework is fully customized and configured in accordance with the specific operational protocols of the respective airline.

A dedicated category for operational forms is integrated directly into this directory. Within this category, standardized templates - including Air Safety Reports (ASR), Cabin Safety Reports (CSR), and Mandatory Occurrence Reports (MOR) - are housed. The necessity for paper-based reporting is entirely eliminated, as these documents are designed to be accessed, populated, and submitted electronically directly within the system.

By interacting with any primary category (Type, Airline, Training & Resources, Forms, etc.) nested sub-categories are sequentially navigated until the targeted individual document or form is located. Upon selection, the designated file is seamlessly rendered within an integrated in-app reader. Within this dedicated environment, a comprehensive suite of interaction tools is provided, ensuring that essential functions - including text highlighting, note annotation, zoom adjustments, and standard viewing capabilities - are readily accessible to facilitate thorough operational review.

Figure 1. Document module

The Clipboard tab is engineered to facilitate the immediate retrieval of high-priority or frequently referenced operational materials. To populate this section, a dedicated bookmarking mechanism is implemented throughout the primary document directory. By engaging the “bookmark” icon situated adjacent to a document’s title, the specific file is instantaneously designated for expedited access. All files marked in this manner are subsequently aggregated and centralized exclusively within the Clipboard tab. Consequently, critical documents can be accessed instantly, thereby circumventing the necessity of repeatedly navigating through the broader organizational folder hierarchies.

Airline Chat

The Airline Chat module is designed to address the necessity for immediate communication between flight crews and the Airline Office during unexpected operational events. While traditional methods previously required phone calls or emails, this feature ensures that the reporting of issues is facilitated in a secure,

streamlined manner, with all communications permanently archived for future reference. An active internet connection is strictly required for this functionality to be utilized.

Upon accessing the Airline Chat, the interface is structurally divided into two primary tabs:

- Submit
- Messages

Within the Submit tab, new communications are composed. Dedicated fields are provided where a subject line and the main text body are entered. Intended recipients are designated by entering their unique “System ID.” If distribution to multiple recipients is required, their respective IDs are entered and separated by commas (e.g., 2, 3, 5), ensuring the message is concurrently delivered to all specified personnel (Figure 2).

Report your issue

Write the issue for manager and get answer ASAP

Submit Tab

Submit

Messages

Charts Updated

Title

Hello Captain. New version of Charts is uploaded to the system.

Main Text

Recipient IDs (comma-separated)

2, 6, 7

Recipients (Separated by Comma)

Required for admin users.

Submit

Figure 2. Submit tab in Airline Chat module

The Messages tab is utilized for reviewing all incoming and outgoing communications. The message view is organized through a pop-up menu, allowing the directory to be filtered by “Inbox,” “Sent,” or “All” messages.

To ensure prompt attention to new communications, a proactive notification system is implemented throughout the module. If an incoming message remains unread, a red warning icon is displayed adjacent to its title. Additionally, a corresponding warning indicator is illuminated next to the “Airline Chat” label on the main left navigation panel. Upon selecting an unread message, the text is rendered, and the item is automatically marked as read, subsequently clearing all associated warning indicators. Should a response

be required, a direct reply mechanism is integrated. By engaging the reply button, a response is initiated and routed straight to the original sender (Figure 3).

Settings

The Settings module is provided for configuration and compliance tracking within the SkyTech Sharif Flight E-Library. Within this module, several critical administrative and preference functions are managed.

- **Updates:** This section is utilized to ensure regulatory compliance by ensuring that personnel are notified of document modifications, and a “read and sign” acknowledgment is required. Whenever a document is added, replaced by a newer version, or deleted, warning icons are displayed adjacent to “Settings” in the main left navigation panel, as well as next to the “Updates” label. The total number of pending notifications is also displayed by these indicators. Specific colors are assigned to categorize the exact nature of the modification: a green indicator is displayed when a new file is added, a yellow indicator is shown when an existing document is replaced, and a red indicator is presented when a file is deleted. Once an added or replaced document is opened and reviewed, an electronic signature is automatically registered by the system, and all associated warning indicators are subsequently cleared (Figure 4).
- **Help:** Additionally, standard support and informational features are housed within this module. By selecting the “Help” option, the comprehensive help documentation for the software is accessed.
- **What’s New:** Upon the release of a new application version, detailed descriptions of system modifications and improvements are displayed within this section. Additionally, newly developed software solutions and products by SkyTech Sharif are presented within this interface, ensuring personnel are kept informed of broader technological advancements and system expansions.

- **Change Password:** Through this option, the default password can be updated to a custom alternative. Upon successful completion of the password modification, the active session is terminated, and a new login process is required to regain access to the system.
- **Light / Dark Mode:** Visual preferences are accommodated through a built-in theme toggle. A Light/Dark mode feature is incorporated into the application, and the preferred interface theme is selected directly within the Settings module to suit individual operational environments.

Figure 4. Manual updates notifications

Manage

The Manage module is designed as the central administrative control panel within the SkyTech Sharif Flight E-Library. Access is strictly restricted to users with Admin privileges, ensuring that the integrity of the operational document repository is maintained securely without unauthorized alterations.

When new operational materials or revisions are required, the document lifecycle is controlled entirely through this section. A precise document title is entered, and the source file is selected from a local computer. After the file is successfully uploaded to the centralized system, it is systematically assigned to the appropriate flight crew members based on operational requirements.

This assignment process is directly linked to the compliance system. Once a new or updated document is assigned to specific pilot users, the mandatory “read and sign” warnings are automatically triggered in their respective accounts, ensuring that all distributed information is tracked and acknowledged.

Furthermore, comprehensive file management capabilities are provided for ongoing maintenance of the digital library. Outdated or incorrect files are securely removed from the system using the delete function, preventing the use of obsolete operational data. Alternatively, the download option is utilized to retrieve specific documents directly to the local machine for administrative review, auditing purposes, or local backup.

Add Pilot

The Add Pilot module is restricted exclusively to Admin users and is designed for the registration of new flight crew members into the system.

To initiate a new account, the pilot's name, email address, and assigned role are entered. Subsequently, the “Create User” button is clicked to finalize the creation process. Upon successful creation of the account, the newly generated username, password, and System ID are immediately displayed on the screen.

The System ID is defined as a unique numeric identifier that is utilized by the system to recognize individual users and manage their respective access permissions and capabilities. It should be noted that comprehensive user specifications are not required during this initial setup phase. Instead, all additional details and operational specifications can be adjusted at a later time within the individual pilot’s Profile section.
